Streamora

Programmable payment streams for creators and DAOs on Solana

The Problem & Our Solution

Lump-sum crypto payments break trust and cash flow between payers and recipients. Streamora fixes this with real-time token streaming.

- Freelancers and DAOs often wait for large, delayed lump-sum payouts
- Payers lack flexibility to pause, adjust, or gate payments to work delivered
- Recipients have no visibility into funds until they land in full
- Streamora unlocks tokens continuously, live in the recipient's wallet
- Milestones let payers tie unlocks to verifiable proof-of-work

How It Works

A payer creates a stream with a rate and duration; the recipient withdraws accrued balance anytime, backed by an on-chain Anchor program.

- Payer opens a stream: sets token, start/end time, and unlock rate
- Recipient withdraws any accrued balance instantly, no waiting for stream end
- Payer can pause, cancel, or top-up the stream while it's active
- Milestone streams require a proof-of-work upload before unlocking funds
- Anchor program on Solana enforces schedules and balances on-chain; React dashboard shows all streams live

Built with

Solana, Anchor, Rust, React, TypeScript, Solana Pay, Wallet Adapter

Why Now & What's Next

Streaming payments are proven (Sablier, Superfluid) but underbuilt on Solana, where low fees make micro-streams practical for the first time.

- Solana's low fees make continuous, real-time micro-payments economically viable
- Growing DAO and freelance economies need flexible, trust-minimized payment rails
- Next: fiat off-ramp integration so recipients can cash out directly
- Next: NFT-gated streams for token-gated communities
- Next: a payroll product tailored to crypto-native startups
